Isothermal vs Adiabatic Comparison: $T = 10.00$ MeV, $n_B^N = 3.0\,n_0$, $a_{Q\star} = 0.540$
composition
$a(x)$
$x < 0$: isothermal a_N
$x < 0$: adiabatic a_N
isothermal
adiabatic
flow speed
$u(x)$ [m/s]
$x < 0$: isothermal u_N
$x < 0$: adiabatic u_N
isothermal
adiabatic
baryon density
$n_B(x)/n_0$
$x < 0$: upstream n_B/n_0
isothermal
adiabatic
kaon chemical potential
$\mu_K(x)$ [MeV]
isothermal
adiabatic
baryon chemical potential
$\mu_B(x)$ [MeV]
$x < 0$: upstream μ_B
isothermal
adiabatic
temperature
$T(x)$ [MeV]
$x < 0$: upstream T
isothermal
