Isothermal vs Adiabatic Comparison: $T = 10.00$ MeV, $n_B^N = 5.0\,n_0$, $a_{Q\star} = 0.300$
composition
$a(x)$
$x < 0$: isothermal a_N
$x < 0$: adiabatic a_N
isothermal
adiabatic
flow speed
$u(x)$ [m/s]
baryon density
$n_B(x)/n_0$
kaon chemical potential
$\mu_K(x)$ [MeV]
baryon chemical potential
$\mu_B(x)$ [MeV]
temperature
$T(x)$ [MeV]
x [nm]
